## **Sturdy Statistics: Nonparametrics and Order Statistics**

By Frederick Mosteller, Harvard University, and Robert E. K. Rourke, formerly Kent School and St. Stephen's School, Rome

This book discusses methods based on signs, counts, and order statistics. It gives the student an opportunity to grasp general statistical concepts and devices for making statistical inferences. Mosteller and Rourke not only present nonparametrics and other methods in common use, but also offer students a set of tools whose uses are much broader in scope than the problems that produced them.

## **Bayesian Inference in Statistical Analysis**

By George E. P. Box and George C. Tiao, University of Wisconsin

This advanced text concentrates on Bayesian analysis of problems commonly met in practice in the physical, biological, and social sciences where little is known *a priori*. Rather than dealing with their sub-

ject on the traditionally philosophical level, the authors consider how Bayesian inference is to be actually used, and how to a large extent it can overcome difficulties encountered with other methods.

## **A First Course in Mathematical Statistics**

By George G. Roussas, University of Wisconsin

Although this book was written for students whose mathematics background falls short of measure theory, real and complex analysis, etc., Roussas introduces the concepts of field and sigma-field and the definition of a random variable as a measurable function. Thence he can develop full proofs of important concepts, greatly aiding the reader's understanding. While theory is stressed, the book is structured so the reader with only a practical interest can skip some of the fine points without undue penalty.

All three books will be available in early 1973. Write to Mary Clare McEwing for your examination copies and the solution to the code.
